Object Oriented Programming

Lesson 07

Deep and shallow copying

Shallow copying

- When a pointer variable is assigned the value of another pointer variable:
 - both variables will contain the same address
 - they point to the same "thing", for example
 - an object
 - an array

Assume the class Circle containing

Constructor: `Circle(int radius = 0);`

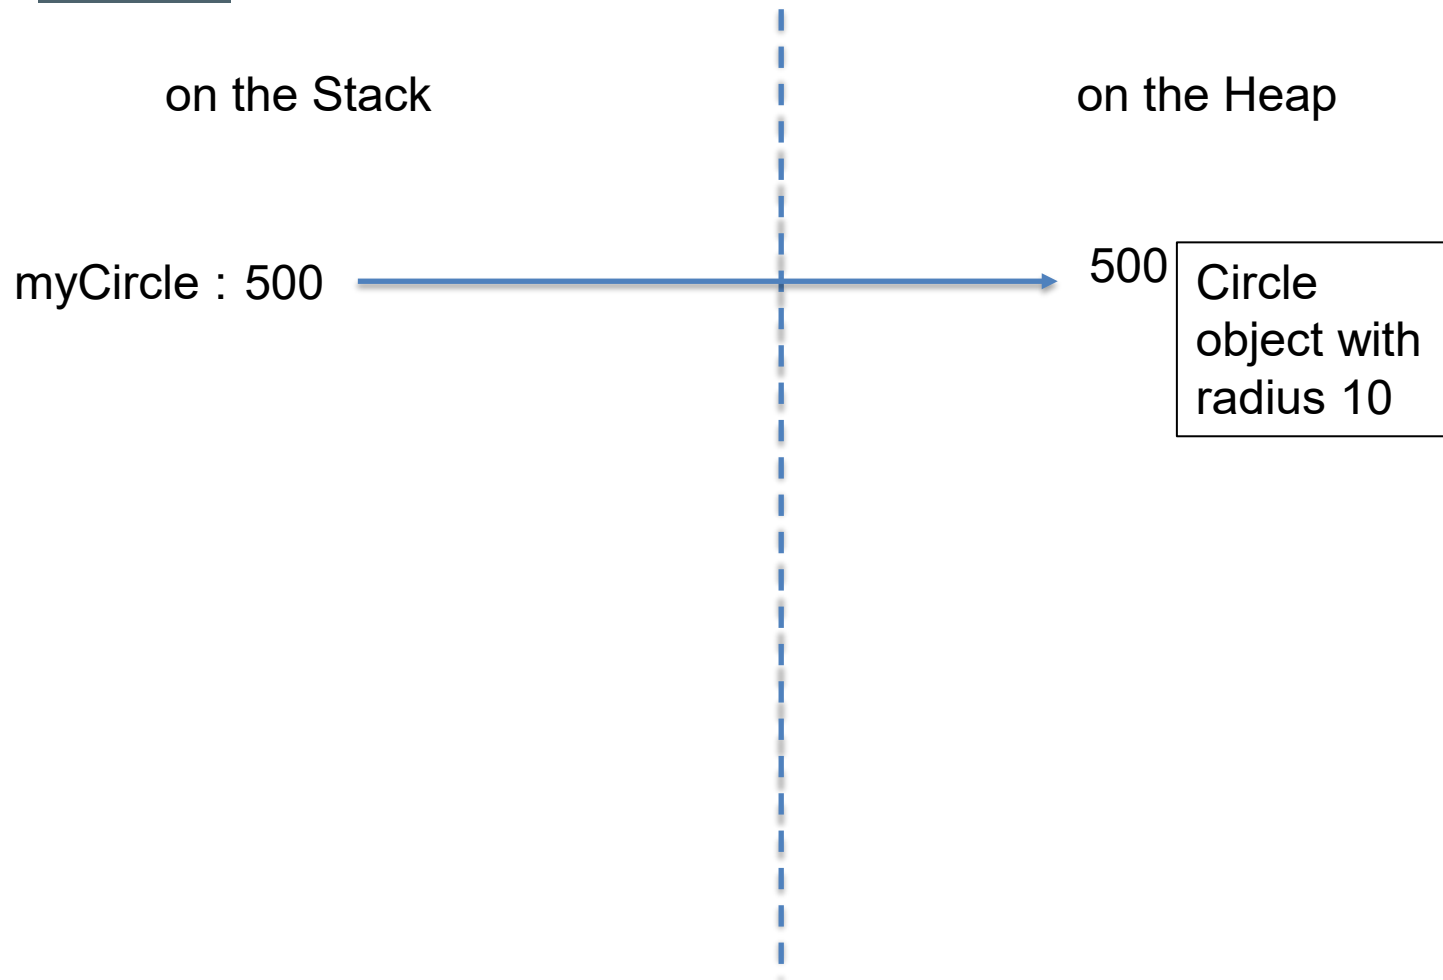

Member functions:

`void setRadius(int radius);`

`int getRadius() const;`

Example 1: Shallow copying

```
Circle *myCircle = new Circle(10);
```

Example 1: Shallow copying (cont)

```
Circle *yourCircle = myCircle;
```

Example 1: Shallow copying (cont)

```
yourCircle->setRadius(12);
```

on the Stack

on the Heap

myCircle : 500

yourCircle : 500

500

Circle
object with
radius 12

Example 1: Shallow copying (cont)

```
cout<<"Radius of myCircle is "  
    <<myCircle->getRadius()<<endl;
```

on the Stack

on the Heap

myCircle : 500

500

Circle
object with
radius 12

yourCircle : 500

Output:

Radius of myCircle is 12

Example 1: Shallow copying (cont)

```
cout<<"Radius of yourCircle is "  
    <<yourCircle->getRadius()<<endl;
```

on the Stack

on the Heap

myCircle : 500

yourCircle : 500

500

Circle
object with
radius 12

Output:

Radius of yourCircle is 12

Example 2: Shallow copying

```
Circle *myCircles = new Circle[3];
```

on the Stack

myCircles : 500

on the Heap

500

| | |
|--------------------------------|-----|
| Circle object with radius 0 | [0] |
| Circle object with radius 0 | [1] |
| Circle object with radius 0 | [2] |

Example 2: Shallow copying (cont)

```
Circle *yourCircles = myCircles;
```

on the Stack

myCircles : 500

yourCircles : 500

on the Heap

500

Circle object
with radius 0

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Example 2: Shallow copying (cont)

```
yourCircles[0].setRadius(12);
```

on the Stack

myCircles : 500

yourCircles : 500

on the Heap

500

Circle object
with radius 12

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Example 2: Shallow copying (cont)

```
cout<<"Radius of myCircles[0] is "  
    <<myCircles[0].getRadius()<<endl;
```

on the Stack

myCircles : 500

yourCircles : 500

on the Heap

500

Circle object
with radius 12

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Output:

Radius of myCircles[0] is 12

Example 2: Shallow copying (cont)

```
cout<<"Radius of yourCircles[0] is "  
    <<yourCircles[0].getRadius()<<endl;
```

on the Stack

myCircles : 500

yourCircles : 500

on the Heap

500

Circle object
with radius 12

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Output:

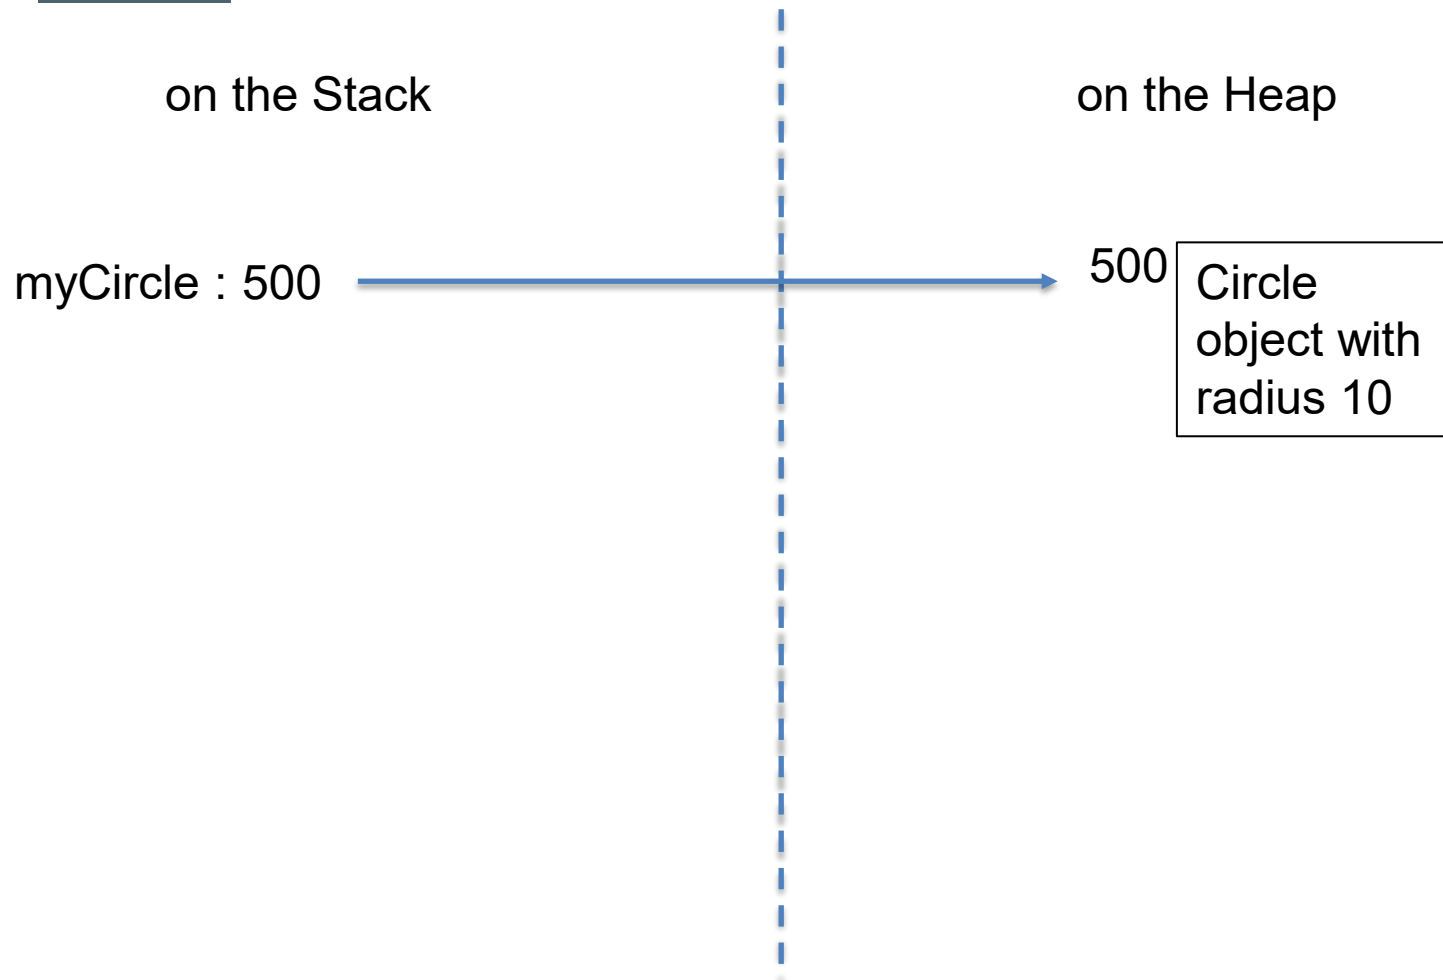

Radius of yourCircles[0] is 12

Deep copying

- When we want a pointer variable to point to an identical "thing" as another pointer variable:
 - the variables must have different addresses
 - they point to different "things" but the content of those things will be identical, for example
 - two identical objects
 - two identical arrays

Example 1: Deep copying

```
Circle *myCircle = new Circle(10);
```

Example 1: Deep copying (cont)

```
int radius = myCircle->getRadius();
```

on the Stack

on the Heap

myCircle : 500

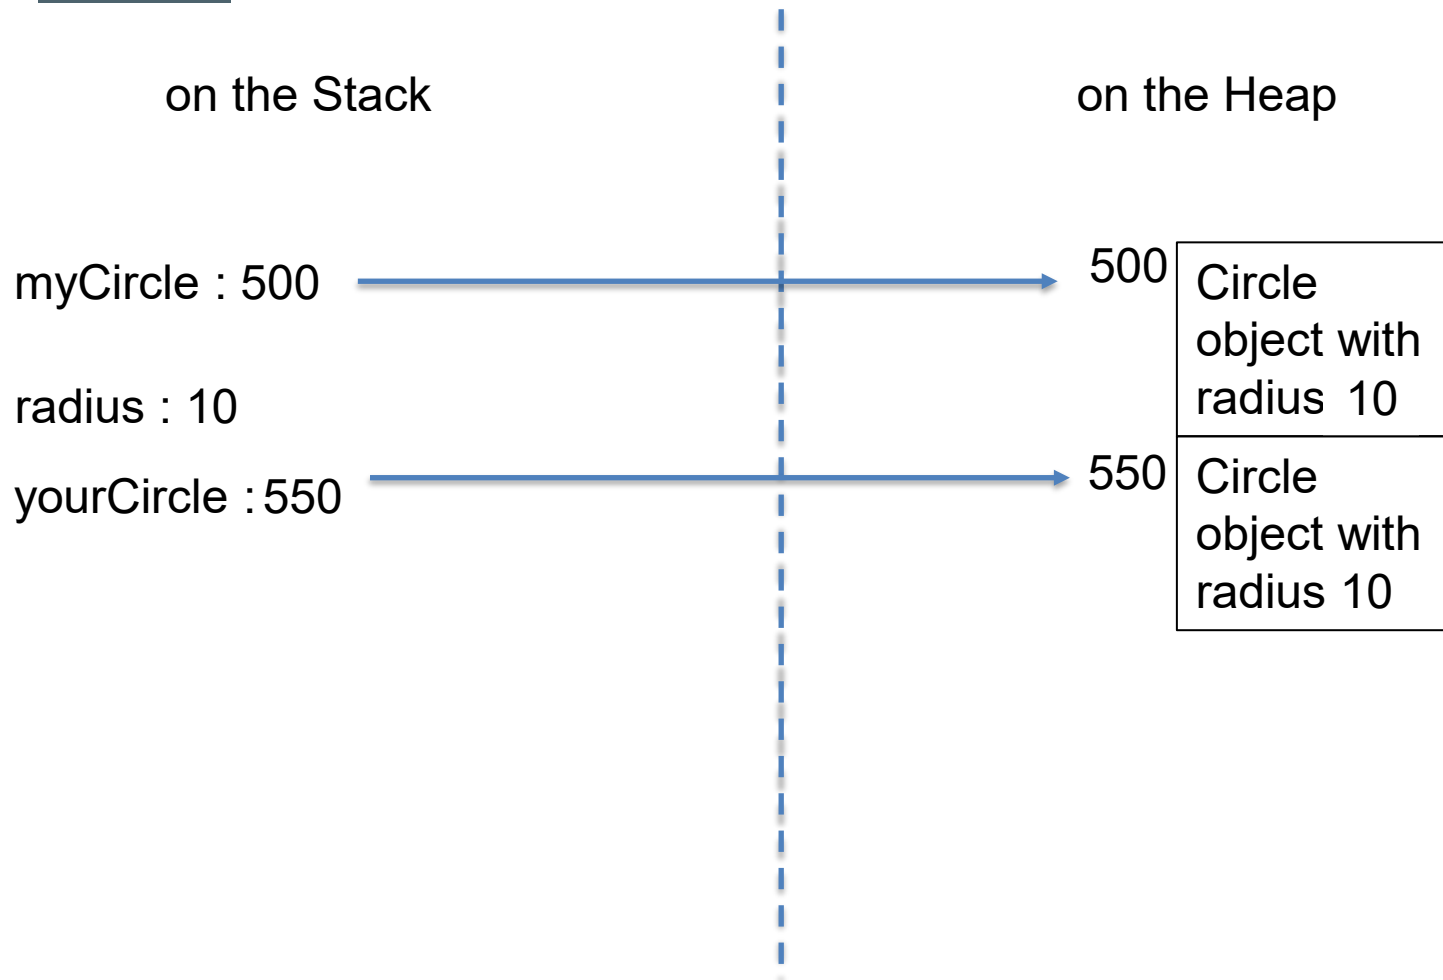

500

radius :

Circle
object with
radius 10

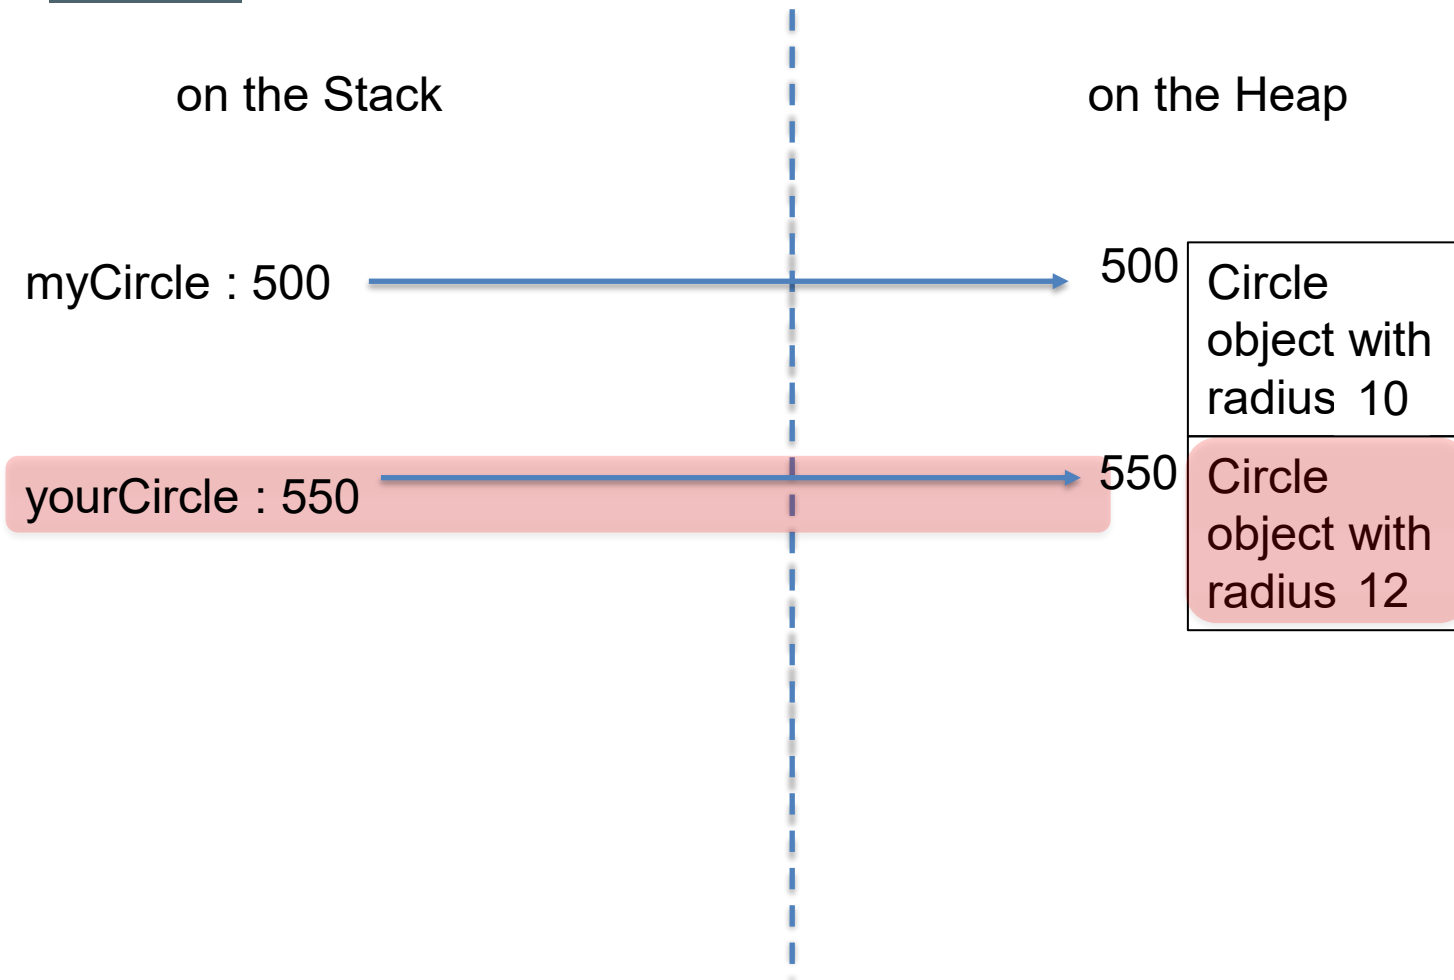

Example 1: Deep copying (cont)

```
int radius = myCircle->getRadius();  
Circle *yourCircle = new Circle(radius);
```

Example 1: Deep copying (cont)

```
yourCircle->setRadius(12);
```

Example 1: Deep copying (cont)

```
cout<<"Radius of myCircle is "  
    <<myCircle->getRadius()<<endl;
```

on the Stack

on the Heap

myCircle : 500

500

Circle
object with
radius 10

yourCircle : 550

550

Circle
object with
radius 12

Output:

Radius of myCircle is 10

Example 1: Deep copying (cont)

```
cout<<"Radius of yourCircle is "  
    <<yourCircle->getRadius()<<endl;
```

on the Stack

on the Heap

myCircle : 500

500

Circle
object with
radius 10

yourCircle : 550

550

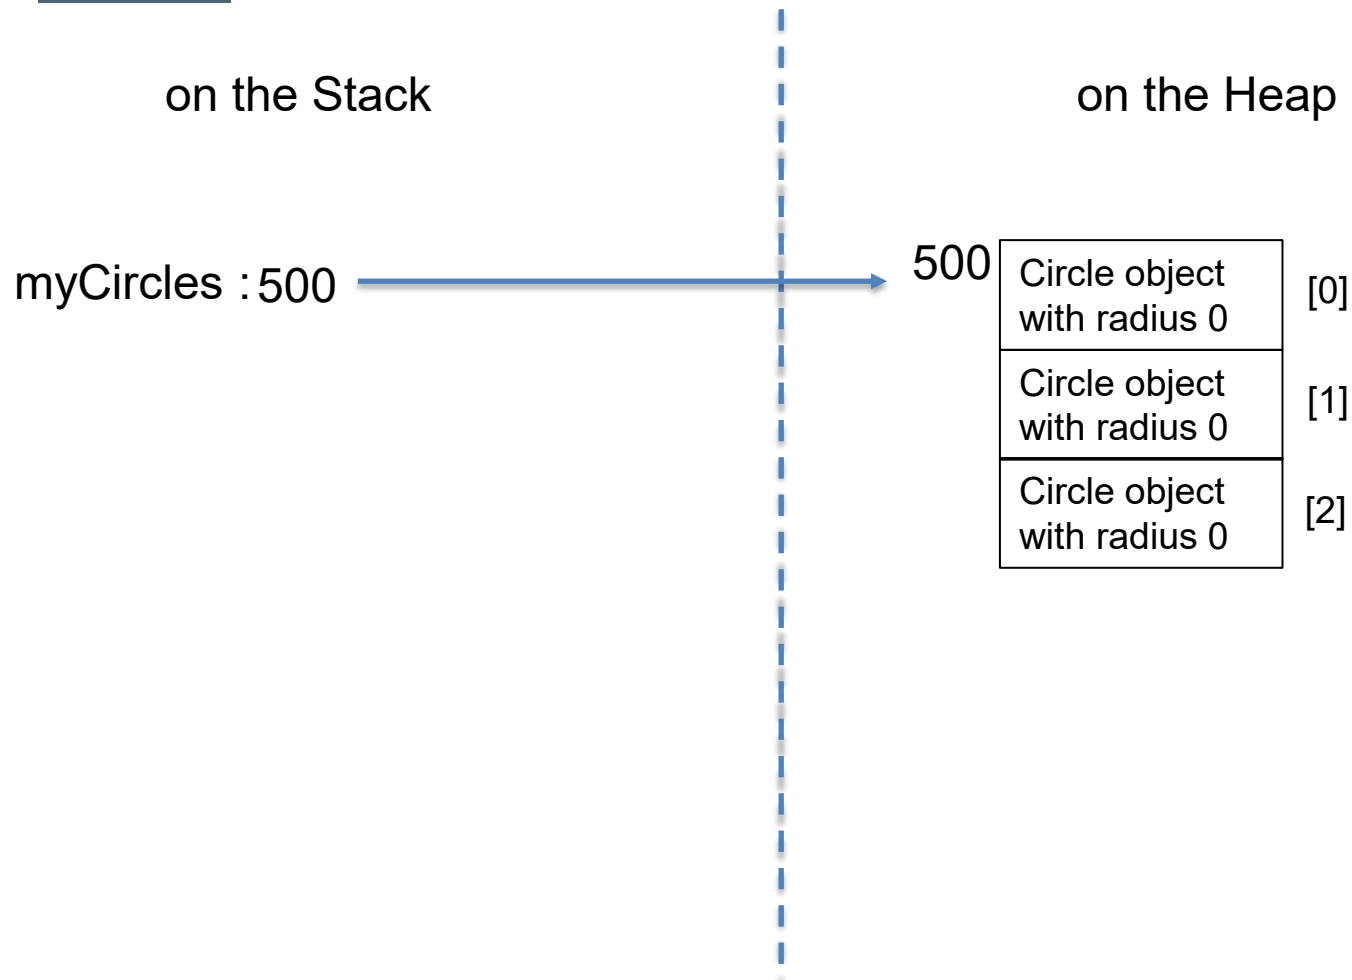

Circle
object with
radius 12

Output:

Radius of yourCircle is 12

Example 2: Deep copying

```
Circle *myCircles = new Circle[3];
```

Example 2: Deep copying (cont)

```
myCircle[0].setRadius(55);
```

on the Stack

myCircles : 500

500

on the Heap

Circle object
with radius 55

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Example 2: Deep copying (cont)

```
myCircle[1].setRadius(75);
```

on the Stack

myCircles : 500

500

on the Heap

| | |
|---------------------------------|-----|
| Circle object with radius 55 | [0] |
| Circle object with radius 75 | [1] |
| Circle object with radius 0 | [2] |

Example 2: Deep copying (cont)

```
myCircle[2].setRadius(4);
```

on the Stack

myCircles : 500

500

on the Heap

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

Example 2: Deep copying (cont)

```
Circle *yourCircles = new Circle[3];
```

on the Stack

myCircles : 500

on the Heap

| | | |
|-----|---------------------------------|-----|
| 500 | Circle object with radius 55 | [0] |
| | Circle object with radius 75 | [1] |
| | Circle object with radius 4 | [2] |
| 650 | Circle object with radius 0 | [0] |
| | Circle object with radius 0 | [1] |
| | Circle object with radius 0 | [2] |

yourCircles : 650

Example 2: Deep copying (cont)

```
for (int i=0; i<3; i++)  
    yourCircles[i] = myCircles[i];
```

on the Stack

myCircles : 500

500

on the Heap

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

yourCircles : 650

650

Circle object
with radius 55

[0]

Circle object
with radius 0

[1]

Circle object
with radius 0

[2]

Example 2: Deep copying (cont)

```
for (int i=0; i<3; i++)  
    yourCircles[i] = myCircles[i];
```

on the Stack

myCircles : 500

500

on the Heap

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

yourCircles : 650

650

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 0

[2]

Example 2: Deep copying (cont)

```
for (int i=0; i<3; i++)  
    yourCircles[i] = myCircles[i];
```

on the Stack

myCircles : 500

500

yourCircles : 650

650

on the Heap

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

Example 2: Deep copying (cont)

```
yourCircles[1].setRadius(67);
```

on the Stack

myCircles : 500

yourCircles : 650

on the Heap

500

Circle object
with radius 55

[0]

Circle object
with radius 75

[1]

Circle object
with radius 4

[2]

650

Circle object
with radius 55

[0]

Circle object
with radius 67

[1]

Circle object
with radius 4

[2]

Classes

- If no constructor is defined in a class it will get an automatically generated **default constructor**
- Furthermore a class will automatically get a generated
 - **Copy constructor**
 - **Assignment operator**
 - **Destructor**

Classes continued

If a class has member variables that are pointers it is necessary to replace the automatically generated

- **Default constructor**
- **Copy constructor**
- **Assignment operator**
- **Destructor**

Copy constructor

- Each class has a copy constructor
- Its purpose is to create an identical copy of another object
- Syntax:
`ClassName(const ClassName ¶meterName)`
- Automatically generated if not defined
 - Uses memberwise copying
 - If a member variable is a pointer this will result in shallow copying

Copy constructor continued

- If the class has at least one member variable which is a pointer it is necessary to:
 - replace the automatically generated copy constructor by implementing it
 - Use memberwise (copy-by-value) copying of member variables that are not pointers
 - Use **deep copying** for member variables that are **pointers**

Call of copy constructor

Classtype variableOfObject = variableOfAnotherObject ;

Ex..

- Circle c1(10);
- Circle c2 = c1; // call of copy constructor

Classtype variableOfObject(variableOfAnotherObject);

- Circle c1(10);
- Circle c2(c1); // call of copy constructor

And also when

- we use call-by-value

Assignment operator

- Each class has an assignment operator
- Its purpose is to create an identical copy of another object
- Syntax:
void operator=(const ClassName ¶meterName)
(return type could also be ClassName or ClassName&)
- Automatically generated if not defined
 - Uses memberwise copying
 - If a member variable is a pointer this will result in shallow copying

Assignment operator continued

- If the class has at least one member variable which is a pointer it is necessary to:
 - replace the automatically generated assignment operator by implementing it
 - If the object is not assigned to itself
 - Deallocate dynamically allocated memory
 - Use memberwise (copy-by-value) copying of member variables that are not pointers
 - Use **deep copying** for member variables that are **pointers**

Call of assignment operator

```
variableOfObject = variableOfObject;
```

```
Circle c1(12);
```

```
Circle c2(10);
```

```
...
```

```
c2 = c1; // call of assignment operator
```

Destructor

- If the class has at least one member variable which is a pointer it is necessary to:
 - Deallocate the memory that has been allocated for the pointers by the object
